Honeywell North® Half-Mask Respirator Donning Instructions

Honeywell Industrial Safety offers a line of Honeywell North Half-Mask respirators that are designed to minimize the breathing of airborne contaminants. But, they must be worn correctly to provide the protection required by NIOSH standards. Before you use your Honeywell North respirator, you should learn how to inspect it, don it, and use it in an emergency. You must become familiar with it in uncontaminated air. This information is covered as part of a complete Respirator Training Program. If you have any questions on this respirator or how to use it, see your supervisor.

Your Honeywell North respirator must be:
- Properly fitted to your face during a routine (usually annual) fit test
- Kept clean and in good working condition
- Worn correctly every time

This poster demonstrates how to inspect and put on your Honeywell North half mask respirator.

**INSPECTION:**
Inspect the respirator before each use. If any parts are missing or damaged, replace those parts or the entire mask.

**ASSEMBLY OF FILTERS AND CARTRIDGES:**
If replaceable particulate filters are not used, go to step 6.

**PUTTING ON YOUR RESPIRATOR:**
If you use eyewear or a hard hat, first complete the respirator donning process — including seal checks with cartridges. Then, you may don other PPE.

**USER SEAL CHECK:**
A positive and negative pressure User Seal Check assures you the respirator is seated correctly and in good working order. Before performing seal checks, exhale vigorously.

If any air leaks are detected during either check, reposition the facepiece and/or readjust the head straps including loosening the straps, if they have been overtightened. Repeat the seal check(s) until a seal is obtained.
